

Kevin Lim

+1 310-694-6224 | cshigh22@berkeley.edu | Berkeley, CA | [linkedin.com/in/kevinslim](https://www.linkedin.com/in/kevinslim)

EDUCATION

University of California, Berkeley, *Bachelor of Arts. Data Science* (GPA: 3.65/4.00) **Dec 2025**

- **Coursework:** Data Engineering, Data Structures, Data Mining & Analytics, Principles and Techniques of Data Science, Probability, Machine Learning, Econometrics, Microeconomics

SKILLS

Programming Languages: Python, Java, SQL, R, HTML/CSS, JavaScript, TypeScript

Tech Stack: React, Node.js, Microsoft Azure, AWS, GCP, Git, Docker, Matplotlib, MongoDB, Linux, PyTorch, pandas, scikit-learn, Power BI, n8n, Carto

Languages: English (native), Korean (bilingual proficiency)

EXPERIENCE

ZEP Quiz, *Software Engineer* - Berkeley, CA **Aug 2025 - Dec 2025**

- Built an end-to-end automation pipeline that pulls trending sports topics (Google Trends), generates multiple-choice quiz questions (OpenAI GPT-5.1 API), renders short-form videos, and uploads to YouTube Shorts.
- Achieved a 93% success rate (up from 65%) by prompt engineering the generation layer for structured JSON output and building a validation-based retry mechanism to handle non-deterministic failures (OpenAI GPT-5.1 API).
- Scaled production to 130+ daily YouTube Shorts by orchestrating n8n workflows with automated scheduling, retries, and conditional branching.

StylistGem, *Backend Engineer Intern* - Remote **May 2025 - Aug 2025**

- Designed and deployed a secure user management system with FastAPI and Auth0, enabling role-based access for 5+ user types.
- Built a robust data layer by implementing 10+ SQLAlchemy schemas (Booking, Payment, Review, Notification), ensuring data consistency and relational integrity across services.
- Streamlined scalability of the booking platform by modularizing 20+ API endpoints and CRUD operations, reducing deployment time by 40% and enabling support for a multi-service ecosystem handling 500+ transactions per week.

Model Predictive Control Lab, *Undergraduate Research Assistant* - Berkeley, CA **May 2024 - May 2025**

- Co-authored paper accepted at L4DC 2025, introducing a generalized Nash equilibrium approach for multi-agent motion planning.
- Designed a lightweight MLP architecture with tanh activations for derivative-based optimization, solving the gridlock problem with 99% feasibility in cooperative scenarios.
- Developed a signed categorical feature encoding strategy to resolve rotational symmetry in intersection data, training distinct, low-latency models that reduced computational complexity by 25% compared to baseline GNE solvers.

PROJECTS

Serverless NFL Data Pipeline | Python, MS Azure, SQL

- Engineered a serverless ELT pipeline using Azure Data Factory and Python, automating the extraction of NFL data from a Blob Storage Data Lake into a SQL Data Warehouse for analytics.

Stock Market Prediction (S&P 500) | Python, pandas, scikit-learn, HuggingFace

- Built an S&P 500 closing-price prediction pipeline using HuggingFace's FinBERT news-sentiment features and a Linear Regression model, achieving RMSE of 66.05 on a time-ordered test split.

Personal Website Project | Python, Azure, HTML, CSS

- Deployed a responsive static website to Azure Static Web Apps, serving over 150+ visitors with integrated CI/CD pipelines using GitHub Actions to automate deployment and updates.

CIFAR-10 Image Classification with Transfer Learning | Python, PyTorch, scikit-learn

- Fine-tuned a pre-trained convolutional neural network on the CIFAR-10 dataset using transfer learning, achieving 85% test accuracy by training only the classifier head.
